

# Lecture 8 – Open-source Software Security

[COSE451] Software Security

Instructor: Seunghoon Woo

Spring 2024

# Overview

- **Open-source software & Licenses**
- **Vulnerabilities in OSS**

# Common Vulnerabilities and Exposures

- **Common Vulnerabilities and Exposures (CVE)**

- A standardized identifier system for tracking and identifying vulnerabilities
  - Discovered in computer systems, networks, software, hardware, and other technologies
- The CVE program is overseen by the MITRE Corporation
  - <https://cve.mitre.org/>
- Currently, approximately 200,000 CVE vulnerabilities are being managed
- CVE-YEAR-NUMBER
  - E.g., CVE-2016-5195

# Common Vulnerabilities and Exposures

- **Common Vulnerabilities and Exposures (CVE)**

Field	Explanation
CVE ID	A vulnerability unique identifier assigned by the MITRE corporation
Descriptions	A summary of the overall introduction of each vulnerability, including affected products and attack vectors
Severity	An indicator that represents the severity of a vulnerability
Types	A value indicating the type of vulnerability, such as buffer overflow or out-of-bounds read/write
Affected software configurations	The name and version information of the software that are affected by the vulnerability
References	A set of reference links related to the vulnerability

# Common Vulnerabilities and Exposures

## 🚩 CVE-2016-5195 Detail

### Description

Race condition in mm/gup.c in the Linux kernel 2.x through 4.x before 4.8.3 allows local users to gain privileges by leveraging incorrect handling of a copy-on-write (COW) feature to write to a read-only memory mapping, as exploited in the wild in October 2016, aka "Dirty COW."

**Severity** CVSS Version 3.x CVSS Version 2.0  
**CVSS 3.x Severity and Metrics:**  
 **NIST:** NVD      **Base Score:** 7.8 HIGH      **Vector:** CVSS:3.1/AV:L/AC:L/PR:L/UI:N/S:U/C:H/I:H/A:H

### Weakness Enumeration

CWE-ID	CWE Name	Source
CWE-362	Concurrent Execution using Shared Resource with Improper Synchronization ('Race Condition')	 NIST

### Known Affected Software Configurations [Switch to CPE 2.2](#)

# Common Vulnerabilities and Exposures

- **Common Vulnerability Scoring System (CVSS)**

- An open standard for assigning scores to rate the severity of vulnerabilities
- Scores are given from 0.0 to 10.0
  - Higher numbers indicating greater severity of the vulnerability

# Common Vulnerabilities and Exposures

- **Common Vulnerability Scoring System (CVSS)**
  - Measurement standard

## Base Score Metrics

### Exploitability Metrics

#### Attack Vector (AV)\*

**Network (AV:N)** Adjacent Network (AV:A) Local (AV:L) Physical (AV:P)

#### Attack Complexity (AC)\*

**Low (AC:L)** High (AC:H)

#### Privileges Required (PR)\*

None (PR:N) **Low (PR:L)** High (PR:H)

#### User Interaction (UI)\*

**None (UI:N)** Required (UI:R)

### Scope (S)\*

Unchanged (S:U) **Changed (S:C)**

### Impact Metrics

#### Confidentiality Impact (C)\*

**None (C:N)** Low (C:L) High (C:H)

#### Integrity Impact (I)\*

**None (I:N)** Low (I:L) High (I:H)

#### Availability Impact (A)\*

None (A:N) Low (A:L) **High (A:H)**

# Common Vulnerabilities and Exposures

- **Common Weakness Enumeration (CWE)**

- A list of common software and hardware weakness types
- Approximately 1,000 CWEs are defined
  - Stack buffer overflow, integer overflow, race condition, out-of-bounds read, etc.
  - [https://cwe.mitre.org/data/published/cwe\\_latest.pdf](https://cwe.mitre.org/data/published/cwe_latest.pdf)

# Common Vulnerabilities and Exposures

- **Common Platform Enumeration (CPE)**
  - A structured naming scheme for information technology systems and software
    - More than 10,000 software/hardware are defined as CPE
  - Used to specify the affected software (including OSS) by vulnerabilities

# Common Vulnerabilities and Exposures

# CVE reporting process

## 1. Discovery

- Discovering vulnerabilities
  - Using static/dynamic analysis
    - These will be covered in more detail in later lectures
  - Penetration testing
- Cause analysis and remediations must also be confirmed at this stage

# CVE reporting process

## 2. Report submission

- Needs to be reported to a CVE Numbering Authority (CNA)
  - CNA: organizations authorized by the CVE Program to assign CVE IDs to vulnerabilities

### CNA Program Growth

Currently, there are **376 CNAs** (374 CNAs and 2 CNA-LRs) from **40 countries** and 1 no country affiliation participating in the CVE Program.

# CVE reporting process

## 2. Report submission

- Needs to be coordinated with CNA: org.

Partner	Scope	Program Role	Organization Type	Country*
<b>Financial Security Institute (FSI)</b>	Vulnerability assignment related to FSI's vulnerability coordination role in the South Korea financial sector that are not in another CNA's scope	CNA	CERT, Researcher, Bug Bounty Provider	South Korea
<b>Hanwha Vision Co., Ltd.</b>	Hanwha Vision (formerly Samsung Techwin and Hanwha Techwin) products and solutions only, including end-of-life (EOL)	CNA	Vendor	South Korea
<b>KrCERT/CC</b>	Vulnerability assignment related to its vulnerability coordination role	CNA	CERT	South Korea
<b>LG Electronics</b>	LG Electronics products only	CNA	Vendor	South Korea
<b>Naver Corporation</b>	Naver products only, except Line products	CNA	Vendor	South Korea
<b>Samsung Mobile</b>	Samsung Mobile Galaxy products, personal computers, and related services only	CNA	Vendor	South Korea
<b>Samsung TV &amp; Appliance</b>	Samsung TV & Appliance products, Samsung-owned open-source projects listed on	CNA	Open Source, Researcher, Vendor	South Korea

Access to vulnerabilities

# CVE reporting process

## 2. Report submission

- Needs to be reported to a CVE Numbering Authority (CNA)
  - CNA: organizations authorized by the CVE Program to assign CVE IDs to vulnerabilities
- A variety of information must be reported together
  - Description, affected products, type, Proof of Concept (PoC), mitigation recommendations, security patches, etc.

# CVE reporting process

## 3. CVE ID assignment

- The CNA reviews the vulnerability report and assigns a unique CVE ID to it
  - Only if it meets the CVE program's criteria
- Thereafter, CNA creates a CVE entry for the vulnerability
  - This entry includes detailed information about the vulnerability such as its description, affected products, severity level, and any relevant references

# Response to vulnerabilities using CVE

- **Two types of vulnerability**
  - Zero-day (0-day)
  - One-day (1-day)

# Response to vulnerabilities using CVE

- **Two types of vulnerability**

- Zero-day (0-day)

- A vulnerability has been discovered, but a patch for it has not been released yet
    - I.e., Unknown vulnerability

- One-day (1-day)

- A vulnerability has been discovered and a patch for it has been announced, but it has not yet been applied
    - It takes time to apply a security patch right away, so attackers target this period

# Response to vulnerabilities using CVE

- **Two main approaches to respond to 1-day vulnerabilities**
  - Version-based approach
  - Code-based approach

# Response to vulnerabilities using CVE

## (1) Version-based vulnerability detection approach

- Detect vulnerabilities based on the name and version of reused OSS

### CVE-2021-32765

Hiredis is a minimalistic C client library for the Redis database. In affected versions Hiredis is vulnerable to integer overflow if provided maliciously crafted or corrupted `RESP` `multi-bulk` protocol data. When parsing `multi-bulk` (array-like) replies, hiredis fails to check if `count \* sizeof(redisReply\*)` can be represented in `SIZE\_MAX`. If it can not, and the `calloc()` call doesn't itself make this check, it would result in a short allocation and subsequent buffer overflow. Users of hiredis who are unable to update may set the [maxelements](https://github.com/redis/hiredis#reader-max-array-

### CVE-2021-32765 Detail

#### Description

Hiredis is a minimalistic C client library for the Redis database. In affected versions Hiredis is vulnerable to integer overflow if provided maliciously crafted or corrupted `RESP` `multi-bulk` protocol data. When parsing `multi-bulk` (array-like) replies, hiredis fails to check if `count \* sizeof(redisReply\*)` can be represented in `SIZE\_MAX`. If it can not, and the `calloc()` call doesn't itself make this check, it would result in a short allocation and subsequent buffer overflow. Users of hiredis who are unable to update may set the [maxelements] (<https://github.com/redis/hiredis#reader-max-array-elements>) context option to a value small enough that no overflow is possible.
